Case Study: Mexico

Mexico, a key market for automotive shipments

Mexico is one of the most important countries when it comes to the usage of on board courier services for time-critical shipments, and the automotive industry is one of the strongest sectors. The country offers an attractive environment for automotive manufacturers and suppliers, leading to a competitive advantage for many international companies in this industry.

In Mexico, the demand for flexible logistic solutions to transport time-critical components and spare parts is increasing, evidential in Chapman Freeborn OBC's rise in daily enquiries from automotive companies to transport from Mexico to the United States.

The most important hubs for OBC shipments are Mexico City (MEX), Querétaro (QRO), Del Bajío (BJX), Chihuahua (CUU), and Monterrey (MTY) in the north of the country.

The following case study shows an OBC transport for time-critical spare parts

17:00 The OBC team receives a telephone enquiry for the transport of important spare parts for automotive production from Guadalajara, México (GDL) to an automotive plant in Detroit. The freight consists of 48 packages (45 kilograms each) and must be collected within 3 hours.

17:15 The client receives a detailed quote for the shipment 15 minutes after the incoming order. After the clients approval, the OBC team book the flight tickets and additional ground modes of transport.

20:00 The Chapman Freeborn courier accepts the delivery in Mexico and starts his journey. Chapman Freeborn couriers are are strategically located throughout the world; this way, Chapman Freeborn can appoint the courier in the closest location. This saves valuable time for the customer.

03:00 The courier arrives at Guadalajara airport (GDL) and completes export formalities for the shipment.

06:37 The flight departs on time on its way to the United States.

08:50 During the transit to Houston the courier clears the shipment with the provided entry number provided by the client. Afterwards, the courier passes the check-in for the connecting flight to Detroit.

EQUIPMENT TYPE: IT Servers and Server Rack

AGOL Worldwide is a top choice of IT and Telecom companies for import services around the globe. A challenge was issued to import IT servers into the United Arab Emirates (UAE) worth USD 50 Million from a customer needing an experience reliable partner. AGOL was also selected as the Importer of Record (IOR) and tasked with managing all the compliance requirements into the UAE. Additionally, AGOL was given the task to manage the entire project “door to door” all the way to the data centers.

Project Details

Our client is a renowned manufacturer and developer of computer hardware and software. A new project was undertaken to upgrade an existing enterprise level data center in the UAE. This project was initiated to upgrade the full package of a small section of an enterprise-level data center.

These servers needed to be custom-built, so AGOL faced a big challenge in sourcing all the equipment from different geographical locations. All the equipment was sourced and shipped from multiple global locations into the UAE in just forty-five days. Completing this project before the deadline was crucial for the successful completion of the project; challenge accepted!

Handling

At AGOL Worldwide the project management team worked closely with eight resellers in planning the project milestones within the project deadline. All the compliance fulfillment was done on priority and before the arrival of goods into the UAE. Maintaining 100% efficiency AGOL managed to import the goods in compliance with all the local regulations. A special handling team was in place to manage the handling of the goods at the airport all the way to the data center. With our experienced AGOL Worldwide team in place the safety and security was ensured all the way to the data center.

Challenges

Servers are built using different components that include, storage devices, processing devices, networking devices, and communication devices. All these are mounted and wired on a rack to complete the server build. All the devices were sourced across the globe and shipped to one location for assembly. Once assembly was done the built servers were shipped to the data center in the UAE.

A single server rack is almost 2m high and requires special cargo handling. Complexities like these contribute to delays in processing. The compliance process is also more complicated with custom products as customs officials are unfamiliar with their values and purpose.

Completion

AGOL Worldwide was honored to be selected as the first choice to manage such an important project with such a critical deadline and was able to exceed our customers' expectations. AGOL thrives in helping customers in such a complex and competitive environment. AGOL's ability to set proper expectations in collaboration with the many vendors for this project ensured every participant knew the lead times and costs upfront. We believe in under promising and over delivering to ensure every customer is pleased with the results of every project, every time!
